## 1 INTRODUCTION

### 1.1 Purpose

The Kulich Shell (KSH) is a command-line interpreter written entirely in x86-64 assembly language using the Netwide Assembler (NASM) syntax. This manual provides comprehensive documentation of the internal structure, register usage patterns, system call interfaces, and operational characteristics of KSH.

### 1.2 System Requirements

KSH requires the following environment:

- x86-64 compatible processor
- Linux operating system (kernel 2.6 or later)
- NASM assembler (version 2.0 or later)
- GNU ld linker
- Minimum 128 bytes of buffer space

### 1.3 Document Conventions

Throughout this manual, the following conventions are observed:

- Register names appear in lowercase: rax, rbx, rcx, etc.
- Hexadecimal values are prefixed with 0x
- System call numbers are shown in decimal
- Memory addresses are shown in hexadecimal
- Assembly mnemonics appear in monospace typeface

## 2 ARCHITECTURE OVERVIEW

### 2.1 Module Organization

The KSH system is organized into three primary modules:

**main.asm** Main control loop and command parsing logic

**io.asm** Input/output operations and buffer management

**utils.asm** Utility functions for path manipulation

## 2.2 Memory Layout

Segment	Size	Purpose
.data	Variable	Static strings and constants
.bss	512 bytes	Uninitialized data buffers
.text	Variable	Executable code

## 2.3 Buffer Allocations

Buffer	Size	Description
buf	128 bytes	Primary input buffer
bff	128 bytes	Secondary buffer (utils)
pth	256 bytes	Path construction buffer
argv	64 bytes	Argument vector (8 pointers)

# 3 SYSTEM CALL INTERFACE

## 3.1 System Call Mechanism

KSH utilizes the Linux x86-64 system call interface. System calls are invoked using the `syscall` instruction with parameters passed in specific registers according to the System V AMD64 ABI.

## 3.2 System Call Register Convention

Register	Purpose
rax	System call number (input), return value (output)
rdi	First argument
rsi	Second argument
rdx	Third argument
r10	Fourth argument
r8	Fifth argument
r9	Sixth argument

## 3.3 System Calls Employed

Number	Name	Description
0	sys_read	Read from file descriptor
1	sys_write	Write to file descriptor
57	sys_fork	Create child process
59	sys_execve	Execute program

Number	Name	Description
60	sys_exit	Terminate process
61	sys_wait4	Wait for process state change

## 4 REGISTER USAGE ANALYSIS

### 4.1 General Purpose Registers

This section documents the specific usage of x86-64 general purpose registers within KSH functions.

#### 4.1.1 RAX Register

**Primary Functions:**

- System call number specification
- System call return value
- Temporary calculations
- Loop counters (specific contexts)

**Usage Examples:**

```

1 mov rax, 1      ; sys_write
2 mov rax, 0      ; sys_read
3 mov rax, 60     ; sys_exit

```

#### 4.1.2 RBX Register

**Primary Functions:**

- Argument vector index counter
- Temporary pointer storage
- General purpose calculations

**Critical Note:** RBX must be preserved across function calls as per ABI.

**Usage Example:**

```

1 push rbx        ; Save
2 mov rbx, 1      ; Index = 1
3 ; ... operations ...
4 pop rbx         ; Restore

```

#### 4.1.3 RCX Register

##### Primary Functions:

- Primary loop counter
- Buffer offset calculator
- String manipulation index

##### Usage Example:

```
1 xor rcx, rcx      ; Initialize counter
2 .loop:
3     ; operations
4     inc rcx
5     cmp rcx, 128
6     jne .loop
```

#### 4.1.4 RDX Register

##### Primary Functions:

- Buffer length specification
- Third system call parameter
- Temporary storage

#### 4.1.5 RSI Register

##### Primary Functions:

- Source buffer pointer
- Second system call parameter
- String operation source

#### 4.1.6 RDI Register

##### Primary Functions:

- Destination buffer pointer
- First system call parameter
- File descriptor specification

#### 4.1.7 R10 Register

**Primary Functions:**

- Fourth parameter for wait4 syscall
- Temporary storage

### 4.2 Register Preservation

The following registers must be preserved (caller-saved):

- RBX, RBP, R12-R15

The following registers are scratch (callee-saved):

- RAX, RCX, RDX, RSI, RDI, R8-R11

## 5 I/O SUBSYSTEM

### 5.1 Print Function

**Function Signature:**

```
void print(char* buffer, size_t length)
```

**Register Usage:**

Register	I/O	Purpose
rsi	Input	Pointer to output buffer
rdx	Input	Length of data to write
rax	Modified	System call number (1), return value
rdi	Modified	File descriptor (1 = stdout)

**Implementation:**

```

1  print:
2      mov rax, 1      ; sys_write
3      mov rdi, 1      ; stdout
4      syscall
5      ret

```

## 5.2 Read Function

**Function Signature:**

```
size_t read(void)
```

**Register Usage:**

Register	I/O	Purpose
rax	Output	Number of bytes read
rcx	Modified	Loop counter for buffer clearing
rsi	Modified	Buffer pointer (buf)
rdx	Modified	Maximum bytes to read (128)
rdi	Modified	File descriptor (0 = stdin)

**Algorithm:**

1. Clear input buffer (128 bytes)
2. Execute sys\_read system call
3. Remove trailing newline character
4. Return number of bytes read

**Implementation Details:**

The read function performs a critical operation: it removes the trailing newline (ASCII 10) that results from the user pressing Enter. This is accomplished by:

1. Testing if any bytes were read (test rax, rax)
2. Decrementing the count to point to last character
3. Comparing byte at buf+rax with 10
4. Setting byte to 0 if newline detected

## 6 COMMAND PROCESSING

### 6.1 Main Loop Structure

The main loop implements the following algorithm:

1. Display prompt (" > ")
2. Read user input
3. Parse and validate command
4. Execute built-in or external command
5. Return to step 1

## 6.2 Built-in Commands

### 6.2.1 exit

Terminates the shell process.

**Syntax:** `exit`

**Implementation:** Executes `sys_exit (60)` with return code 0.

**Byte Comparison Sequence:**

```

1  cmp byte [buf], 'e'
2  jne .check_clear
3  cmp byte [buf+1], 'x'
4  jne .check_clear
5  cmp byte [buf+2], 'i'
6  jne .check_clear
7  cmp byte [buf+3], 't'
8  jne .check_clear
9  cmp byte [buf+4], 0
10 je _exit

```

### 6.2.2 clear

Clears the terminal screen using ANSI escape sequences.

**Syntax:** `clear`

**ANSI Sequence:** `ESC[2J ESC[H`

**Byte Representation:**

`27, '[' , '2' , 'J' , 27, '[' , 'H'`

### 6.2.3 info

Displays shell information with color formatting.

**Syntax:** `info`

**ANSI Color Sequence:**

`ESC[1;38;5;2;49m ... ESC[0;39;49m`

**Color Breakdown:**

- 1 = Bold
- 38;5;2 = Foreground green (256-color mode)
- 49 = Default background
- 0;39;49 = Reset to defaults

### 6.3 External Command Execution

#### 6.3.1 Command Parsing Algorithm

The parser implements a state machine to convert space-delimited input into an argv array:

1. Set argv[0] to start of buffer
2. Scan for space characters
3. Replace spaces with null bytes
4. Skip consecutive spaces
5. Set argv[n] to next non-space character
6. Terminate with NULL pointer

#### Register Usage During Parsing:

Register	Purpose
rdi	Pointer to argv array
rsi	Pointer to current position in input buffer
rcx	Offset counter within buffer
rbx	Index of current argument (1, 2, 3, ...)

#### State Machine Diagram:

```
START -> SCAN_WORD -> FOUND_SPACE -> SKIP_SPACES -> SCAN_WORD
-> FOUND_NULL -> FINISH
```

#### 6.3.2 Process Creation

External commands are executed using the fork-exec pattern:

1. Fork: sys\_fork (57) creates child process
2. Parent: sys\_wait4 (61) waits for child completion
3. Child: sys\_execve (59) replaces process image

#### Fork Implementation:

```
1 mov rax, 57      ; sys_fork
2 syscall
3 test rax, rax    ; Check return value
4 jz .child        ; θ = child process
5 jl main_loop     ; < θ = error
```

**Parent Wait Implementation:**

```

1 mov rdi, rax      ; PID of child
2 mov rax, 61       ; sys_wait4
3 xor rsi, rsi     ; status = NULL
4 xor rdx, rdx     ; options = 0
5 xor r10, r10     ; rusage = NULL
6 syscall

```

**Child Exec Implementation:**

```

1 .child:
2   mov rdi, [argv]    ; Program path
3   lea rsi, [argv]    ; Argument vector
4   xor rdx, rdx      ; Environment = NULL
5   mov rax, 59        ; sys_execve
6   syscall
7   ; If exec fails, exit with status 1
8   mov rax, 60
9   mov rdi, 1
10  syscall

```

## 7 UTILITY FUNCTIONS

### 7.1 make\_path Function

**Purpose:** Concatenates ”/usr/” prefix with a relative path.

**Function Signature:**

```
void make_path(char* buf, char* path)
```

**Parameters:**

- rdi: Pointer to source path
- rsi: Pointer to destination buffer

**Algorithm:**

1. Load ”/usr/” string address
2. Copy prefix to destination using lodsb/stosb
3. Decrement destination to overwrite null terminator
4. Copy source path to destination
5. Return with concatenated string

**Register Usage:**

Register	Purpose
rbx	Saved on stack, used for "/usr/" pointer
rsi	Source pointer for lodsb
rdi	Destination pointer for stosb
al	Byte transfer register

**String Instructions:**

- **lodsb**: Load byte from [rsi] into al, increment rsi
- **stosb**: Store al into [rdi], increment rdi

## 8 DATA STRUCTURES

### 8.1 Static String Table

Label	Length	Content
msg	16 bytes	Welcome message
shs	3 bytes	Shell prompt ">"
kms	43 bytes	Info message with ANSI codes
clr	7 bytes	Clear screen ANSI sequence
nln	1 byte	Newline character
usr	6 bytes	"/usr/" path prefix

### 8.2 BSS Segment Layout

```
+-----+
| argv (64 bytes) | <- 8 quadword pointers
+-----+
| buf (128 bytes)| <- Main input buffer
+-----+
| bff (128 bytes)| <- Utility buffer
+-----+
| pth (256 bytes)| <- Path buffer
+-----+
```

## 9 ERROR HANDLING

### 9.1 System Call Failures

System calls return negative values on error. KSH implements minimal error checking:

- Fork failure: Returns to main loop

- Read failure (EOF): Continues main loop
- Exec failure: Child exits with status 1

## 9.2 Invalid Commands

If a command is not recognized as a built-in and cannot be executed as an external program, the execve system call will fail and the child process terminates with exit code 1.

# 10 BUILD SYSTEM

## 10.1 Makefile Structure

The build system uses GNU Make with the following configuration:

### Variables:

- ASM = nasm
- LD = ld
- ASMFLAGS = -f elf64 -g
- LDFLAGS = (empty)
- TARGET = ksh

### Build Process:

1. Assemble .asm files to .o object files
2. Link object files into executable

### Targets:

- all: Build executable
- run: Build and execute
- clean: Remove build artifacts

## 10.2 Compilation Commands

### Assembly:

```
nasm -f elf64 -g src/io.asm -o build/io.o
```

### Linking:

```
ld build/io.o build/main.o build/utils.o -o ksh
```

## 11 COMPLETE SOURCE CODE LISTINGS

### 11.1 io.inc - Interface Definitions

```
1 extern read
2 extern print
3 extern buf
4 extern make_path
```

### 11.2 io.asm - Input/Output Module

```
1 section .bss
2 global buf
3 buf: resb 128
4
5 section .text
6 global print
7 global read
8
9 print:
10    mov rax, 1
11    mov rdi, 1
12    syscall
13    ret
14
15 read:
16    xor rcx, rcx
17 .clear_buf:
18    cmp rcx, 128
19    je .done_clear
20    mov byte [buf+rcx], 0
21    inc rcx
22    jmp .clear_buf
23 .done_clear:
24    mov rax, 0
25    mov rdi, 0
26    mov rsi, buf
27    mov rdx, 128
28    syscall
29    ; remove \n
30    test rax, rax
31    jz .done
32    dec rax
33    cmp byte [buf+rax], 10
34    jne .done
35    mov byte [buf+rax], 0
```

```

36 .done:
37     ret

```

### 11.3 main.asm - Main Control Module

```

1 %include "include/io.inc"

34     test al, al
35     jne .copy_bff
36     pop rbx

```

37

**ret**

## 12 PERFORMANCE CHARACTERISTICS

### 12.1 Time Complexity

Operation	Complexity	Notes
Buffer clear	$O(n)$	Linear scan, $n=128$
Command parse	$O(n)$	Single pass, $n=\text{input length}$
Built-in check	$O(1)$	Fixed comparisons
Path concat	$O(n+m)$	$n=\text{prefix, } m=\text{path length}$

### 12.2 Space Complexity

Total static allocation: 512 bytes (BSS) + 100 bytes (data)

### 12.3 System Call Overhead

Each command execution incurs:

- 1 sys\_read (input)
- 1 sys\_write (prompt)
- 1 sys\_fork (external commands)
- 1 sys\_execve (external commands)
- 1 sys\_wait4 (external commands)

## 13 LIMITATIONS AND KNOWN ISSUES

### 13.1 Buffer Overflow Vulnerability

The input buffer is fixed at 128 bytes with no bounds checking. Input exceeding this limit will cause buffer overflow.

### 13.2 No Environment Variables

The execve call passes NULL for the environment pointer, so child processes have no environment.

### 13.3 No PATH Resolution

Commands must be specified with full path or relative to current directory. The shell does not search standard PATH locations.

### 13.4 No Redirection or Pipes

Standard I/O redirection and pipeline operations are not implemented.

### 13.5 No Job Control

Background processes, job suspension, and process groups are not supported.

## 14 FUTURE ENHANCEMENTS

### 14.1 Proposed Features

- PATH environment variable support
- Command history buffer
- Tab completion
- Signal handling (SIGINT, SIGTSTP)
- Wildcard expansion
- I/O redirection (>, <, »)
- Pipeline support (|)
- Command substitution

### 14.2 make\_path Integration

The make\_path function is currently unused in the main codebase. Future versions should integrate this for automatic /usr/ prefix resolution.

## 15 APPENDIX A: ASCII REFERENCE

### 15.1 Control Characters

Decimal	Hex	Character
0	0x00	NUL (null terminator)
10	0x0A	LF (line feed)
27	0x1B	ESC (escape)
32	0x20	SPACE

### 15.2 Command Characters

Character	Decimal	Hex
'a'	97	0x61
'c'	99	0x63
'e'	101	0x65
'f'	102	0x66
'i'	105	0x69
'l'	108	0x6C
'n'	110	0x6E
'o'	111	0x6F
'r'	114	0x72
't'	116	0x74
'x'	120	0x78

## 16 APPENDIX B: X86-64 REGISTER REFERENCE

### 16.1 General Purpose Registers (64-bit)

Register	ABI Status	Description
RAX	Volatile	Accumulator, syscall number/return
RBX	Non-volatile	Base register (must preserve)
RCX	Volatile	Counter register
RDX	Volatile	Data register
RSI	Volatile	Source index
RDI	Volatile	Destination index
RBP	Non-volatile	Base pointer (must preserve)
RSP	Non-volatile	Stack pointer (must preserve)
R8-R11	Volatile	Additional general purpose
R12-R15	Non-volatile	Additional (must preserve)

### 16.2 Special Purpose Registers

Register	Description
RIP	Instruction pointer (program counter)
RFLAGS	Status flags (ZF, SF, CF, OF, etc.)

## 17 APPENDIX C: ANSI ESCAPE SEQUENCES

### 17.1 Color Codes

Sequence	Effect
ESC[0m	Reset all attributes
ESC[1m	Bold / increased intensity
ESC[38;5;Nm	Set foreground color (N = 0-255)
ESC[39m	Default foreground color
ESC[49m	Default background color

## 17.2 Screen Control

Sequence	Effect
ESC[2J	Clear entire screen
ESC[H	Move cursor to home (0,0)
ESC[K	Clear line from cursor to end

## 18 INDEX

- Argument parsing, 11
- argv array, 11
- Buffer allocation, 3
- Built-in commands, 9
  - clear command, 9
  - exit command, 9
  - Fork-exec pattern, 12
  - info command, 10
  - make\_path function, 13
  - print function, 7
  - read function, 7
- Register conventions, 4
- System calls, 4
  - sys\_execve, 5
  - sys\_exit, 5
  - sys\_fork, 5

- sys\_read, 5
- sys\_wait4, 5
- sys\_write, 5
